## In-Memory Computing Platform 6.1.8

- Project modularization and dependency cleanup
- Other bug fixes and enhancements
- Visor management and monitoring
  - File Manager: added ability to search in subfolders
  - Updated scala libs from 2.10.3 to 2.10.4 version
  - Other bug fixes and enhancements

## In-Memory Computing Platform 6.1.5

- Added java.util.Set implementation to distributed cache datastructures
- Added support for synchronous evicts in replicated cache
- Other bug fixes and enhancements
- Visor management and monitoring
  - Added support for search and replace in configuration and Sql editors.
  - Sql Viewer Tab: added possibility to change query "Page Size" (number of rows to fetch at once) at any moment
  - Extended filters for charts on Datagrid Tab (added filtering by caches), GGFS Tab (added filtering by nodes), Streaming Tab (added filtering by streamers)
  - Other bug fixes and enhancements

## In-Memory Computing Platform 6.1.1

- Enhancements for JDK8 lambdas support
- Enhancements and bug fixes for rendezvous affinity function

## In-Memory Computing Platform 6.1.0

- Added support for distributed execution of JDK8 lambdas
- Added support for rendezvous affinity function and "fair" affinity function for better partition distribution between data nodes
- Added support for geospatial indexes in data grid queries
- Significant performance improvements in distributed queue implementation
- Fixed problem with multicast IP finder in some environments

- Enhanced events API
- Other bug fixes and enhancements
- Visor management and monitoring
  - Enhanced data center replication UI
  - Other bug fixes and enhancements

## In-Memory Computing Platform 6.0.3

- Added support for atomic mode for distributed cache with near cache enabled
- Added support for atomic mode for local cache
- Datacenter replication: improvements and bug fixes and documentation improvements
- REST configuration made optional
- Other bug fixes and enhancements
- Visor Management and monitoring
  - Fixed issues when more than 1 Visor are connected to the grid
  - Other bug fixes and enhancements

## In-Memory Computing Platform 6.0.2

- Simplified configuration
- Simplified documentation
- Migrated to Maven Central
- Performance improvements for continuous queries
- Other bug fixes and enhancements
- Visor Management & Monitoring
  - Improvements to datacenter replication tab
  - Added ability to view existing indexes
  - Added ability to scan cache contents even with indexes disabled (supported in command line visor as well)

## In-Memory Computing Platform 6.0.1

- Removed all deprecated code
- Added Bi-directional WAN Datacenter Replication across different geographies
- Added local restartable store for disk-based recovery in case of large cluster failures
- Added ATOMIC mode for REPLICATED cache
- Added Near cache and Client-only mode to REPLICATED cache
- Added Hibernate L2 cache out-of-the-box integration
- Added GridLifecycleAware callbacks to all configurable grid components
- Significant performance improvements to network I/O
- Significant performance improvements to C++ client
- Significantly simplified all examples and migrated them to Maven for easier integration with IDEs
- API changes (not backward compatible)
  - Refactored GridProjection into following components and significantly simplified APIs
    - GridProjection - clustering and logical grid node grouping
    - GridCompute - distributed computations on the grid
    - GridMessaging - topic-based message exchange functionality
    - GridEvents - distributed event notifications
    - GridScheduler - cron-based scheduling functionality
    - GridProduct - product information and licensing functionality
  - Refactored GridCacheProjection into following components and significantly simplified APIs
    - GridCacheProjection - data manipulation, transactions, and locking functionality
    - GridCacheAffinity - data partitioning and key-to-node mapping functionality
    - GridCacheQueries - SQL, scan, and full text search queries
    - GridCacheDataStructures - various grid-aware data structures similar in APIs to `java.util.concurrent` package
  - Removed GridFunc and significantly simplified `org.gridgain.grid.lang` package
  - Removed `typedef` package and replaced all class aliases with class names
- Various other fixes and performance improvements
- Visor Management & Monitoring
  - New tabs for datacenter replication send and receive counterparts
  - Added SQL syntax highlighting to SQL Queries tab
  - Performance improvements to command-line Visor (moved it off of Scala REPL)

## In-Memory Data Grid 5.3.3

- Fixed slow memory leak in query execution.

- Fixed slow memory leak in the lock methods in cache projection with predicate.

## **In-Memory HPC/Data Grid 5.3.1, Streaming 2.1.1, Hadoop Accelerator 2.1.1**

- Rolling updates feature in this release is not compatible with previous releases due to significant enhancements to messaging protocol.
- Added auto-unsubscribe of continuous queries and continuous event notifications if requester node leaves grid.
- Added binding to all network interfaces on startup if local host is not explicitly specified.
- Visor Management New Features and Enhancements
  - Added ability to open multiple node tabs at once.
  - Added ability to view files directly from GGFS File Manger either using system viewer or internal visor viewer.
  - Added execution plan option to SQL Viewer tab.

## **In-Memory HPC/Data Grid 5.3.0**

- Fixed issues related to memory consumption.
- Added eager cache entry expiration based on time-to-live.
- Cleaned up examples structure.
- Enhancements and bug fixes.

## **Streaming 2.1.1, Hadoop Accelerator 2.1.1**

- Enhancements and bug fixes.

## **In-Memory HPC/Data Grid 5.2.2, Streaming 2.0.2, Hadoop Accelerator 2.0.2**

- Added support for Web Session caching, automatic web session fault tolerance, load balancing, and expiration.
- Added magic bytes to discovery messages to make sure that other applications would not be send messages to GridGain.
- Added automatic back-pressure for FULL\_ASYNC write synchronization mode to avoid possible out-of-memory condition under load.
- Added API and performance optimizations for synchronous query execution.
- Other bug fixes and enhancements.
- Visor Management New Features and Enhancements
  - Added Visor remote connectivity support. Now you can use Visor to monitor remote grids without having to become a grid member. For example, you can have your grid running on a public cloud and start Visor Console on your local laptop.
  - Fixed issue when CPU was greater than 100% on charts.

## **In-Memory HPC/Data Grid 5.2.1, Streaming 2.0.1, Hadoop Accelerator 2.0.1**

- Fixed backward version compatibility issue

## **In-Memory HPC/Data Grid 5.2.0 Release Notes**

- Fixed slow memory leak in query execution.
- Fixed slow memory leak in the lock methods in cache projection with predicate.
- Added Multicast-based IP Finder to GridTcpDiscoverySpi.
- Added backward compatibility support to allow different versions of GridGain run in the same cluster.
- Added rich performance suggestions on startup.
- Implemented PRIMARY\_SYNC mode for partitioned transactional cache.
- Significantly reduced size of cache entry.
- Changed node consistent hash ID from node ID to `ip:port` combination to ensure that node remains in same consistent hash position upon restart.
- Deprecated evictionEnabled flag.
- Implemented optional asynchronous message sending based on NIO functionality (in addition to existing NIO-based message receiving).
- Implemented clock-versioning in distributed caches to speed up FULL\_SYNC mode.
- Removed serialization of values put in cache or off-heap when value is of primitive byte-array type.
- Significantly improved error messages and usability suggestions.
- Added performance suggestions for non-optimal configurations.
- Numerous enhancements and bug fixes.

## **In-Memory Streaming 2.0 Release Notes**

- Added Hash-based and Tree-based indexes for rolling windows.
- Numerous enhancements and bug fixes.

## **In-Memory Accelerator for Hadoop® 2.0 Release Notes**

- Added MapReduce over GGFS functionality.
- Numerous enhancements and bug fixes.

## **In-Memory HPC/Data Grid 5.1.6 Release Notes**

- Added CLIENT\_ONLY mode for partitioned cache.
- Added ATOMIC atomicity mode which provides better performance for non-transactional use cases.
- Added optional GridOptimizedMarshallable interface to help optimized marshaller remove internal lookups.
- Added one-phase commit in TRANSACTIONAL mode for basic put and putAll operations.
- Added automatic back-pressure control for async operations.
- Multiple fixes/enhancements to Visor Management Console

## **In-Memory Accelerator for MongoDB® 1.0b Release Notes**

- Available in GridGain Maven Repository.
- Support for all MongoDB commands except for aggregation framework.
- Support for automatic repartitioning.
- Provided benchmarks to compare performance with native MongoDB.
- Visor Management New Features and Enhancements
  - New Visor MongoDB tab for management and monitoring of Mongo databases and collections stored in GridGain.

## **In-Memory Accelerator for Hadoop® 1.2 Release Notes**

- Available in GridGain Maven Repository.
- Visor Management New Features and Enhancements
  - Improved time accuracy in Profiler tab to nanoseconds.
  - Default folders for every operational mode are optionally created upon GGFS (re)format.
  - Ability to turn logging on and off when profiler starts and stops.

## **In-Memory Streaming 1.1 Release Notes**

- Available in GridGain Maven Repository.
- Minor bug fixes.
- Visor Management New Features and Enhancements
  - Added query metrics to Streaming tab.

## **In-Memory HPC/Data Grid 5.1.2 Release Notes**

- Available in GridGain Maven repository
- Added direct client-to-node connectivity mode for remote clients.
- Added type-based filtering to `Continuous Query` functionality.
- Added `AutoCloseable` to all main grid APIs.
- Added `GridCacheCountDownLatchExample`.
- Visor Management New Features and Enhancements
  - Fixed partition ID formatting in Database tab.

## **In-Memory Accelerator for Hadoop® 1.0 Release Notes**

- Available in GridGain Maven repository.
- New Features and Enhancements
  - Added support for Hadoop 2.0 in addition to Hadoop 1.0.
  - Added DUAL\_ASYNC mode to allow asynchronous writes to HDFS.
  - Added asynchronous delete in GGFS.
  - Added formatting function to GGFS.
  - Added additional metrics to GGFS.
- Visor Management New Features and Enhancements
  - Added hot-key support to File Manager tab.
  - Added enhanced search capabilities to File Manager tab.
  - Added Profiler tab to profile GGFS and HDFS performance and identify hotspots on the fly
  - Ability to profile various read and write metrics.
  - Access uniformity to control which sections of the file get accessed the most.
  - Ability to take profiling snapshots.
  - Ability to clear and reset profiler data.
  - Ability to filter based on GGFS mode as well as file names.

## In-Memory Streaming 1.0b (Beta) Release Notes

- Available in GridGain Maven repository.
- New Features and Enhancements
  - Direct support for Complex Event Processing (CEP).
  - Pluggable rolling event windows
    - Support for batch windows.
    - Support for unique and sorted windows.
    - Support for bounded and unbounded windows.
  - Pluggable routing.
  - Affinity event collocation with GridGain in-memory data grid nodes.
  - Branching pipelines.
- Visor Management New Features and Enhancements
  - New Streaming tab to manage and monitor all deployed streamers including.

## In-Memory HPC/Data Grid 5.1 Release Notes

- Available in GridGain Maven repository
- New Features And Enhancements
  - New continuous querying capability.
  - New continuous remote event notification capability.
  - Implemented efficient IPC communication between multiple nodes started on the same host.
  - Added off-heap metrics to GridCacheProjection.
  - Added examples for direct GGFS API usage.
  - Added EVT\_CACHE\_PRELOAD\_OBJECT\_LOADED and EVT\_CACHE\_PRELOAD\_OBJECT\_UNLOADED to notify listeners if an object got pre-loaded or unloaded by the system.
- Visor Management New Features and Enhancements
  - Many convenience and usability enhancements to UI.
- Core Bug Fixes
  - Deprecated GridJobAdapterEx in favor of GridJobAdapter and GridJobContinuationAdapter.
  - Fixed NotSerializableException in GridOptimizedMarshaller in JDK7.
  - Multiple bug fixes for IPC communication.

## Gridgain 5.0 Release Notes

- New Features And Enhancements
  - New off-heap memory mode allowing to cache all keys on-heap and all values off-heap.
  - New GridFileSwapSpaceSpi which caches all keys in-memory and keeps all values on local file system.
  - GGFS - GridGain distributed in-memory file system.
  - GridGgfsHadoopFileSystem - Hadoop FileSystem adapter for GGFS to be used together with or instead of HDFS or any other Hadoop file system.
  - Support of automatic read-through and write-through to and from HDFS or any other Hadoop file system.

- Support for high-throughput IPC over shared memory on Linux.
- Series of GGFS vs. HDFS benchmarks to demonstrate performance differences.
- Improved IO and thread context switching to achieve significant performance improvements for high-throughput messaging and job execution.
- Visor Management New Features and Enhancements
  - New GGFS tab to manage and monitor various GGFS properties.
  - New FileManager tab to provide various file system operation within the same file system and across different file systems.
- Core Bug Fixes
  - Fixed handling of spaces in Windows .bat scripts.

## GridGain 4.5.0 Release Notes

- New Features And Enhancements
  - HyperLocking to minimize locking and serialization overhead for cache transactions under load.
  - Risk Analytics benchmark.
  - Custom SQL Functions including GridCacheQueryCustomFunctionExample to show how to use them.
  - Full off-heap indexing to GridH2IndexingSpi.
  - Execution plan printout for long queries by setting GridH2IndexingSpi.setLongQueryExplain(true) parameter.
  - Topic-based user message exchange.
  - GridNoopCheckpointSpi to remove checkpoint overhead whenever checkpoints are not used.
  - GridNoopSwapSpaceSpi to remove swap space overhead whenever it is not used.
- Visor Management New Features and Enhancements
  - Added telemetry screen in Visor to show overall grid status based on various metrics.
  - Added dedicated cache tab to show all cache-specific information.
- Core Bug Fixes
  - Path space issues in ggstart.bat startup script.
  - Deadlock with concurrent evictAll() and unswapAll().
  - Query iterators are removed but not closed when originating node leaves or fails.
  - Restructured all examples to make them easier to use and understand.
- Client Connectivity Bug Fixes
  - Removed ADD method from client API as it was identical to putIfAbsent method.
- Visor Management Bug Fixes
  - Visor graph tooltip does not show whole information.
  - Visor spits errors (failed to fetch model update) when new node joins and busy with data pre-loading.

## GridGain 4.3.1 Release Notes

- New Features and Enhancements
  - Added remove operation to data loader.
  - Significantly improved performance of partition to node mapping.
  - Added GridSerializationBenchmark for comparing performance of Java, Kryo, and GridGain serialization.
  - Added property-based configuration to remote clients.
  - Optimized concurrency for asynchronous methods in C++ client.
- Core Bug Fixes
  - Unmarshalling of SimpleDateFormat fails with NPE.
  - Possible NPE in Indexing Manager when using distributed data structures.
  - Swap partition iterator skips entries if off-heap iterator is empty.
  - GridDataLoader does not allow to cache primitive arrays.
  - Excessive memory consumption in indexing SPI.
  - Add check on startup that GridOptimizedMarshaller is supported by running JDK version.
  - If ordered message is timed out, other messages for the same topic may not be processed.
  - ScalarPiCalculationExample does not provide correct estimate for PI.
- Client Connectivity Bug Fixes
  - Client router with explicit default configuration leads to NPE.
  - Repair REST client support to make session token and client ID optional.
  - Ping does not work properly in C++ client.
- Visor Management Bug Fixes
  - Clear and Compact operations in Visor do not account for node selection.

- Move Visor management tasks into a separate thread pool.
- Preload dialog in Visor does not show correct number of keys.
- GC dialog in Visor waits indefinitely for dead nodes.
- Increase tooltip dismiss time in Visor.
- Visor log search does not show nodes table correctly on Windows.

## GridGain 4.x Release Notes

- In-Memory Data Grid / Distributed Cache.
- Off-Heap BigMemory Storage to avoid lengthy GC pauses when using large amounts of memory.
- Indexing SPI for pluggable highly concurrent in-memory indexing.
- Data Loader for efficient bulk-load operations on cache.
- Distributed data structures
  - Distributed Atomic Sequence.
  - Distributed Atomic Long.
  - Distributed Stamped Reference.
  - Distributed Count Down Latch.
  - Distributed bounded and unbounded queues.
- Near-only cache (enabling cache operations without participating in caching).
- Partition-only cache.
- Significant optimizations for Collocated cache operations.
- Delayed and manual repartitioning to avoid excessive network traffic on topology changes.
- Write-behind caching.
- Synchronized cache evictions with other cache nodes.
- Distributed cache garbage collector to monitor/remove stale locks.
- Significantly reduced cache memory consumption.
- Compute Grid
  - Significant optimizations on all levels utilizing concurrent data structures.
  - Distributed Continuations and Recursive Split.
- Remote Client Connectivity
  - Affinity-aware Java Remote Client.
  - Affinity-aware .NET Remote Client.
  - Affinity-aware C++ Remote Client.
  - REST-based HTTP Remote Client.
  - Affinity Aware Router/Gateway for remote client connectivity.
  - JAAS-based authentication of remote clients.
  - Secure communication protocol for establishing secure channels between remote clients and grid nodes
    - RememberMe secure session SPI.
  - Clustering / Networking
  - Pluggable Network Segmentation Policies to handle Split-Brain Network Segmentation
    - Basic reachability segmentation resolver.
    - Shared file system segmentation resolver.
    - TCP connection segmentation resolver.
  - Support for authentication of cluster nodes
    - JAAS-based authentication SPI.
    - Passcode-based authentication SPI.
- Marshalling
  - Optimized Marshalling achieving 20x faster serialization than standard Java serialization.
- Management And Monitoring.
- Visual GUI-based Visor Management And Monitoring
  - Dashboard Tab
    - View CPU and Heap Charts.
    - View grid topology and metrics for all grid nodes.
    - Start/stop/restart any number of remote nodes.
    - Dynamically view/update license at runtime.
    - Integration with VisualVM for automatic JVM profiling of remote nodes.
    - Visual thread dump of any grid node.
    - View and search logs from any of the nodes.
    - View Grid events.
  - Group Tab

- Provides functionality identical to Dashboard for any subgroup of the nodes.
- Host Tab
  - Provides functionality identical to Dashboard for all nodes started on a specific host.
- Node Tab
  - Provides functionality identical to Dashboard for a specific node.
  - Various views of metrics, configuration, and system or environment properties for given node.
- In-Memory HPC Tab
  - View various charts for currently executing and waiting jobs.
  - View tasks executions including split information and nodes assignments.
  - Ability to map tasks and jobs to nodes and vise versa.
- In-Memory Data Grid Tab
  - View various charts regarding cache hits/misses/reads/writes/commits/rollbacks.
  - View statistical information about all caches defined.
  - Ability to map from caches to nodes and from nodes to caches.
  - Execute various management commands such as *compact*, *clear*, *swap*, *preload*, *load*, etc...
- Object Browser Tab
  - View metadata/schema of all cached deployed in the grid.
  - Run SQL queries on any of the nodes and caches using built-in SQL viewer.

## GridGain 3.x Release Notes

- In-Memory Data Grid
  - Distributed in-memory key-value store.
  - Local / Replicated / Partitioned caches.
  - Full support for ACID transactions
    - Optimistic / Pessimistic transactions.
    - Read-Committed / Repeatable-Read / Serializable isolation levels.
    - JTA / JCA Integration.
  - Disk-based Swap overflow storage
    - LevelDB swap storage SPI.
  - Pluggable eviction policies
    - LRU
    - FIFO
    - Random
    - Time-based
  - MVCC-based concurrency.
  - Synchronous and Asynchronous cache operations.
  - Replication and Invalidation modes.
  - Read-Through and Write-Through behavior for pluggable GridCacheStore.
  - Pluggable data partitioning.
  - SQL Queries for in-memory data
    - Affinity-based collocated queries.
    - Predicate-based full-scan queries.
    - Remote query transformations.
    - Local and Remote query result reduction.
    - Lucene-based text queries.
  - H2-based Data Indexing for SQL queries.
  - OOP and FP-based APIs for Java and Scala.
  - Automatic support for object cloning.
- Compute Grid
  - Distributed cache as checkpoint storage.
  - Affinity routing for partitioned in-memory data grid.
  - GridNodeLocal cache for storing shared state between jobs.
  - Distributed continuations for suspending/resuming job execution.
  - Cron-based scheduling.
- Clustering / Networking
  - TCP-based Discovery SPI.
    - Pluggable IP-Finders.
      - In-VM IP Finder
      - Amazon S3 IP Finder

- Shared-FS IP Finder
  - Support for 1000+ node topologies.
- Management And Monitoring
  - Shell-based Visor Management And Monitoring.
    - Support for various grid topology and configuration commands.
    - Support for custom user-defined management commands.
  - JMX-based Management and Monitoring.

## GridGain 2.x (and earlier) Release Notes

- Compute Grid
  - In-Memory MapReduce.
  - Pluggable failover
    - Job-stealing failover SPI.
  - Pluggable topology
    - Basic topology SPI.
    - Node-attributes topology SPI.
    - Node-filter topology SPI.
  - Pluggable collision resolution
    - Fifo-queue collision resolution SPI.
    - Priority collision resolution SPI.
    - Job stealing collision resolution SPI.
  - Pluggable job checkpointing
    - JDBC-based checkpoint SPI.
    - Shared file system checkpoint SPI.
    - Amazon S3 checkpoint SPI.
  - Pluggable load balancing
    - Round-robin load balancing SPI.
    - Weighted-random load balancing SPI.
    - Adaptive load balancing SPI.
  - Pluggable event storage
    - In-memory event storage SPI.
  - Pluggable node discovery
    - Multicast-based node discovery SPI.
  - Job Stealing for keeping all nodes equally loaded.
  - Distributed task session.
  - AOP-based job execution.
  - Support for redundant job mapping.
  - Support for partial reduction.
  - Zero deployment and Peer Class Loading.
  - SPI-based architecture.
  - GridGain loaders for automatic blending into any environment (e.g. app servers, web servers, embedded, stand alone, etc...).
